

Exercise README

Simple exercise for writing your own function and unit tests.

Exercise

Create a function that concatenates two strings together, e.g., 'abc' and 'def' should output 'abcdef'. Try satisfying *Minimum Requirements* first. You may then try to implement *Additional Specifications*.

Minimum Requirements:

- inputs should be character array, string, or cell array of character arrays
- output should be character array or string
- empty inputs should return empty output

Additional Specifications:

- inputs must be scalar
- output must be character array

You may use script, function, or class based unit test - use your personal preference.

Try to complete the exercise without looking at a *possible* [solution](#).
